Fungi

of the Mornington Peninsula

The Mornington Peninsula supports a diverse mix of vegetation communities and habitat types – ranging from grassy plains, woodlands, damp forests and coastal scrubs. While there is a good understanding of the types and numbers of flora and fauna species that occur on the peninsula, little is known about how many types of fungi can be found within these communities – though it is highly likely that fungi are varied and well represented.

Fungi colonise almost every terrestrial habitat. Some fungi grow in sand dunes, others in native grasslands, many appear

in garden beds and lawns, but the greatest diversity of fungus species is usually found in woodlands and forests.

This guide presents 96 of the more recognisable fungus species that grow in the range of habitats of the Mornington Peninsula.

Almost all of the fungi presented appear in autumn, although they can appear in other seasons depending on environmental conditions, and especially in response to fluctuations in rainfall and temperature.

What are fungi?

Fungi are not plants or animals but belong to their own kingdom of organisms – the Kingdom Fungi. Unlike plants that use chlorophyll to manufacture food (known as photosynthesis), fungi are more like animals in that they secrete enzymes to break down organic matter and then absorb nutrients.

The fungus organism itself exists within soils or wood or other substrates.

Under particular conditions, often related to an increase in moisture and decrease in temperature, the fungus will produce a sporing body such as a mushroom.

While the classic umbrella mushroom shape is familiar to many people, fungus sporing bodies are diverse and appear in many forms - such as puffballs or jellies.

Fungus groups

Fungi can be grouped together based on aspects of their appearance, including their form, shape or structure. These groupings are known as morphogroups.

Each morphogroup in this guide is colour coded, and each species within its morphogroup is arranged alphabetically by its scientific name. There are 14 morphogroups presented in this guide, along with an additional 'invasive' section at the end.

 Agarics	 Fungi with Pores	 Tooth fungi	 Corals	 Jellies
 Chanterelles	 Stinkhorns	 Birdnests	 Earthstars/Puffballs	 Cups
 Discs	 Clubs	 Morels	 Lichens	 Invasive

How fungi feed

Fungi obtain their nutrition in different ways – these are known as trophic modes. Some are recyclers that break down organic material while others form mutual relationship with plants.

Some fungi, such as the Australian Honey Fungus and the Ghost Fungus can switch between different trophic modes.

Regardless of a their trophic mode, all of these different types of fungi are all vital to healthy, functioning ecosystems.

The trophic mode of each species presented in this guide is indicated by the letters S, M, P and Y.

Trophic mode	Description	Key
Saprotrophic	Recyclers that break down organic material and release nutrients that they then absorb	S
Mycorrhizal	Forms mutually beneficial relationships with plants	M
Parasitic	Derives nutrition from a living host	P
Symbiotic	Involves an interaction between another organism and living in close physical association	Y

Fungus substrates

Fungi grow in different substrates including soil, living or dead wood, leaf litter, animal scats (dung) and invertebrates.

The type of substrate where each species is usually found is indicated within the species profile of each fungus in this guide.

Species profiles

Each fungus presented in this guide is contained within a species profile. Information displayed in each species profile includes its morphogroup, common and scientific names, size, substrate, and trophic mode.

Agarics

Horse Mushroom
Agaricus arvensis
 8cm high x 20cm wide
 Soil (S)

Yellow Stainer
Agaricus xanthodermus
 7cm high x 11cm wide
 Soil (S)

Australian Flour Lepidella
Amanita farinacea gp.
 10cm high x 5cm wide
 Soil (M)

Vermillion Grisette
Amanita xanthocephala
 6cm high x 3cm wide
 Soil (M)

Australian Honey Fungus
Armillaria luteobubalina
 12cm high x 5cm wide
 Wood (S,P)

Australian Funnel Pax
Austropaxillus infundibuliformis
 5cm high x 6.5cm wide
 Soil (S,M)

Egg-yolk Fieldcap
Bolbitius titubans
 10cm high x 5cm wide
 Soil(S)

Shaggy Parasol
Chlorophyllum brunneum
 5-20cm high x 3cm wide
 Soil (S)

Clitocybe semioculta
 1cm high x 1.5cm wide
 Wood (S)

Agarics

Collybia eucalyptorum
6cm high x 4cm wide
Wood (S)

Fairy Inkcap
Coprinellus disseminatus
3cm high x 1.5cm wide
Wood (S)

Lawyers Wig
Coprinus comatus
10cm high x 3cm wide
Soil (S)

Emperor Cortinar
Cortinarius archeri
10cm high x 10cm wide
Soil (M)

Green Skinhead
Cortinarius austrovenetus
10cm high x 5cm wide
Soil (M)

Splendid Red Skinhead
Cortinarius persplendidus
10cm high x 5cm wide
Soil (M)

Elegant Blue Webcap
Cortinarius rotundisporus
7cm high x 5cm wide
Soil (M)

Slimy Yellow Cortinar
Cortinarius sinapicolor
8cm high x 9cm wide
Soil (M)

Variable Oysterling
Crepidotus variabilis
1.5cm wide
Soil (S)

Agarics

Ruby Bonnet
Cruentomycena viscidocruenta
3cm high x 0.5cm wide
Wood (S)

Green Stem Pinkgill
Entoloma rodwayi
5cm high x 5cm wide
Soil (S)

Velvet Shank
Flammulina velutipes
2-8cm high x 1-5cm wide
Wood (S)

Moss Bell
Galerina hypnorum gp.
3cm high x 1cm wide
Wood (S)

Galerina patagonica gp.
7cm high x 4.5cm wide
Wood (S)

Spectacular Rustgill
Gymnopilus junonius
5-25cm high x 10cm wide
Wood (S)

Ghoul Fungus
Hebeloma aminophilum
7cm high x 5cm wide
Soil (S)

Blackening Waxcap
Hygrocybe astatogala
8cm high x 5cm wide
Soil (S)

Vermillion Waxcap
Hygrocybe miniata gp.
3cm high x 3.5cm wide
Soil (S)

Agarics

Sulphur Tuft
Hypholoma fasciculare
 3-10cm high x 2-6cm wide
 Wood (S)

Saffron Milkcap
Lactarius deliciosus
 10cm high x 10cm wide
 Soil (M)

Eucalypt Milkcap
Lactarius eucalypti gp.
 4cm high x 3.5cm wide
 Soil (M)

Blewit
Lepista nuda
 10cm high x 15cm wide
 Soil (S)

Redlead Roundhead
Leratiomyces ceres
 3-6cm high x 2-6cm wide
 Soil (S)

White Dapperling
Leucoagaricus leucothites
 5-12cm high x 4-15cm wide
 Soil (S)

Leucopaxillus eucalyptorum
 10cm high x 10cm wide
 Soil (M)

Australian Parasol
Macrolepiota clelandii
 15cm high x 9cm wide
 Soil (S)

Little Stinker
Marasmiellus affixus
 1.5cm high x 1.5cm wide
 Wood (S)

Agarics

Velvet Parachute
Marasmius elegans
 4cm high x 3cm wide
 Soil (S)

Fairy-ring Mushroom
Marasmius oreades
 3cm high x 2cm wide
 Soil

Mycena austrofilopes
 12cm high x 2cm wide
 Soil (S)

Mycena clarkeana gp.
 9cm high x 4cm wide
 Wood (S)

Yellow Stemmed Mycena
Mycena epipterygia
 5cm high x 1.5cm wide
 Wood (S)

Pixie's Parasol
Mycena interrupta
 5mm high x 5mm wide
 Wood (S)

Nargan's Bonnet
Mycena nargan
 4cm high x 1cm wide
 Wood (S)

Mycena subgalericulata gp.
 7cm high x 2cm wide
 Wood (S)

Ghost Fungus
Omphalotus nidiformis
 13cm high x 10cm wide
 Wood (S,P)

Agarics

Rooting Shank
Oudemansiella gigaspora gp.
 15cm high x 3cm wide
 Wood (S)

Mauve-splitting Waxcap
Porpolomopsis lewellinae
 7cm high x 3-6cm wide
 Soil (S)

Dung Roundhead
Protostropharia semiglobata
 3-12cm high x 1-4cm wide
 Dung (S)

Golden Top
Psilocybe subaeruginosa
 10cm high x 4cm wide
 Soil (S)

Orange Mosscep
Rickenella fibula
 4cm high x 1cm wide
 Soil (S)

Austral Dripping Bonnet
Roridomyces austrororidis
 2.7cm high x 1.6cm wide
 Wood (S)

Russula persanguinea
 6cm high x 6cm wide
 Soil (M)

Splitgill
Schizophyllum commune
 0.5cm high x 4cm wide
 Wood (S)

Stropharia formosa
 8cm high x 5cm wide
 Soil (M)

Agarics

Burgundy Wood Tubaria
Tubaria rufofulva
 5cm high x 6.5cm wide
 Wood (S)

Beefsteak Fungus
Fistulina hepatica
 25cm wide
 Wood (S)

Spring Polypore
Lentinus arcularius
 2-6cm high x 1-8cm wide
 Wood (S)

Honeycomb Fungus
Hexagonia vesparia
 5cm wide
 Wood (S)

Giant Bolete
Phlebopus marginatus
 3cm high x 15cm wide
 Soil (M)

Fungi with Pores

Coltricia sp.
 10cm wide
 Wood (S)

White Punk
Laetiporus portentosus
 40cm wide
 Wood (S)

Rainbow Fungus
Trametes versicolor
 5-7cm wide
 Wood (S)

Tooth Fungi

Echidna Fungus
Hydnum crocidens
3cm high x 3cm wide
Soil (M)

Black Tooth
Phellodon niger gp.
4cm high x 5cm wide
Wood (M)

Golden Splash Tooth
Phlebia subceracea
Wood (S)

Yellow Club
Clavaria amoena
10cm high
Soil (M)

White Club
Clavulina subrugosa
8cm high
Soil (M)

Flame Fungus
Clavulinopsis sulcata
7cm high
Soil (M)

Pale Buff Coral
Ramaria filicicola
10cm high
Soil (M)

Yellow Tufted Coral
Ramaria lorithamnus
10cm high
Soil (M)

Corals

Jellies

Pretty Horn
Calocera sinensis gp.
1-1.5cm high
Wood (S)

Golden Jelly Bells
Heterotextus peziziformis gp.
0.3-0.6cm wide
Wood (S)

Jelly Tooth
Pseudohydnum gelatinosum
4cm high x 1.4cm wide
Wood (S)

White Brain
Tremella fuciformis
3cm high x 10cm wide
Wood (S)

Yellow Brain
Tremella mesenterica
5cm high x 10cm wide
Wood (S)

Chanterelles

Pink Chanterelle
Cantharellus concinnus
6cm high x 1.5-4cm wide
Soil (S)

Craterellus australis
3-5cm high x 4.5cm wide
Soil (S)

Pagoda Fungus
Podoserpula pusio
6cm high x 3cm wide
Wood (S)

Stinkhorns

Anemone Stinkhorn
Aseroe rubra
 10cm high x 3cm wide
 Soil (S)

Octopus Stinkhorn
Clathrus archeri
 12cm high x 9cm wide
 Soil (S)

Smooth Cage
Ileodictyon gracile
 8cm high x 8cm wide
 Soil (S)

Birdsnests

Fluted Bird's Nest
Cyathus striatus
 1cm high x 0.8cm wide
 Wood (S)

Earthstars

Collared Earthstar
Geastrum triplex
 2cm high x 5cm wide
 Soil (S)

Cups

Orange Peel Fungus
Aleuria aurantia
 2cm high x 2-10cm wide
 Soil (S)

Discs

Charcoal Cup
Anthracobia muelleri
0.2-0.5cm wide
Soil (S)

Black Tacks
Lanzia lanaripes
2cm high x 1cm wide
Wood (S)

Yellow Earth Buttons
Phaeohelotium baileyannum
1cm wide
Soil (S)

Clubs

Dark Vegetable Caterpillar
Drechmeria gunnii
12cm high
Invertebrate (P)

Morels

Morel
Morchella sp.
12cm high
Soil (S,M)

Lichens

Gold Dust Lichen
Chrysothrix candelaris
Wood (Y)

Yellow Navel
Lichenomphalia chromacea
2-5cm high x 1-4cm wide
Soil (Y)

Invasive Fungi

Fly Agaric
Amanita muscaria
10cm high x 12cm wide
Soil (M)

Orange Pore Fungus
Favolaschia claudopus
2cm high x 3cm wide
Wood (S)

Enjoying fungi in the wild

While learning about the different fungi in your area is an exciting pastime, it pays to admire fungi with respect to the role they play within ecosystems. This includes not picking them to ensure that they can continue to thrive.

Remember that it is illegal to collect fungi on public land without a written permit. Mornington Peninsula Shire does not endorse the consumption of any fungi referenced in this guide.

Record fungus observations with iNaturalist

iNaturalist is a free, easy to use app where you upload photos to record, share and identify your fungus observations. Actively recording your observations on iNaturalist helps to share knowledge and is a great way to learn about local animals, plants and fungi on the Mornington Peninsula.

How to use iNaturalist

- Download the 'iNaturalist' App on iTunes or Google Play on your smart phone, or visit the iNaturalist Australia website on your computer
- Sign up to create your profile or login if you're already a user
- Head outdoors to snap photos of local fungi and upload them to the app.

iNaturalist

Tea-tree Fingers

Named for its distinctive, finger-like form, Tea-tree fingers was first discovered in the 1990s, and is listed as critically endangered in Victoria.

In the 2000s, Tea-tree Fingers was found in bushland on the Mornington Peninsula, though it has not been recorded again since.

All fungi have particular requirements for survival – in the case of Tea-tree Fingers, it requires large areas of long-unburnt habitat, continual availability of freshly fallen wood material for its host to grow in, as well as a symbiotic partner for survival.

Submitting photos of fungi to databases such as iNaturalist can assist researchers in confirming Tea-tree Fingers sightings, helping to better understand its range.

Fungi in your garden

Fungi perform a variety of important functions, such as recycling organic matter, providing soil structure and supporting plants, while also providing a food source for some local wildlife.

Encouraging fungi to thrive in your garden contributes to the overall biodiversity values in your local area.

To maximise the diversity of fungi in your garden, on your farm or in your land restoration project aim to:

- Create diverse habitats – in particular, retain a diversity of organic matter from large old logs and stags through to fine organic matter such as sticks and leaves. This provides microhabitats and microclimates that may accommodate a greater range of fungi
- Minimise or eliminate disturbance such as over digging, ploughing, raking, over-watering, soil compaction
- Some fungi rely on native mammals to distribute spores. Protect and connect habitat to create corridors that encourage wildlife movement.
